ATSC Standard: AVC Video Transport Subsystem Characteristics

Document A/72 Part 2, 29 July 2008

Advanced Television Systems Committee, Inc.
1750 K Street, N.W., Suite 1200
Washington, D.C. 20006

The Advanced Television Systems Committee, Inc., is an international, non-profit organization developing voluntary standards for digital television. The ATSC member organizations represent the broadcast, broadcast equipment, motion picture, consumer electronics, computer, cable, satellite, and semiconductor industries.

Specifically, ATSC is working to coordinate television standards among different communications media focusing on digital television, interactive systems, and broadband multimedia communications. ATSC is also developing digital television implementation strategies and presenting educational seminars on the ATSC standards.

ATSC was formed in 1982 by the member organizations of the Joint Committee on InterSociety Coordination (JCIC): the Electronic Industries Association (EIA), the Institute of Electrical and Electronic Engineers (IEEE), the National Association of Broadcasters (NAB), the National Cable Telecommunications Association (NCTA), and the Society of Motion Picture and Television Engineers (SMPTE). Currently, there are approximately 140 members representing the broadcast, broadcast equipment, motion picture, consumer electronics, computer, cable, satellite, and semiconductor industries.

ATSC Digital TV Standards include digital high definition television (HDTV), standard definition television (SDTV), data broadcasting, multichannel surround-sound audio, and satellite direct-to-home broadcasting. Contact information is given below.

Note: The user's attention is called to the possibility that compliance with this standard may require use of an invention covered by patent rights. By publication of this standard, no position is taken with respect to the validity of this claim or of any patent rights in connection therewith. One or more patent holders have, however, filed a statement regarding the terms on which such patent holder(s) may be willing to grant a license under these rights to individuals or entities desiring to obtain such a license. Details may be obtained from the ATSC Secretary and the patent holder.

Advisory Notice

In issuing this standard, the ATSC recognizes that it includes encoding and decoding techniques for digital television transmission which are not backwards compatible with existing MPEG-2-based ATSC DTV deployments. Transitional issues associated with continuing service to existing receivers, how and when to deploy advanced-capability receivers, allocation of channel bit capacity, and related issues should be considered. ATSC recognizes that this standard will be utilized more readily in countries that have not yet implemented digital terrestrial television broadcasting systems, or in countries that have achieved internal agreement on a transition plan.

The revision history of this document is given below.

ATSC Standard:

AVC Video Transport Subsystem Characteristics

1. SCOPE

This Part describes the transport of ATSC A/72 Part 1 (“AVC”) video in the ATSC Digital Television System. The syntax and semantics of this specification conform to ATSC A/53 Part 3 [1], with additional constraints specified in this standard. “AVC” in this Part refers to the constrained version of ITU-T Rec. H.264 | ISO/IEC 14496-10 [2] as defined in Part 1 of this Standard.

2. REFERENCES

At the time of publication, the editions indicated were valid. All standards are subject to revision and amendment, and parties to agreements based on this Standard are encouraged to investigate the possibility of applying the most recent editions of the documents listed below.

2.1 Normative References

The following documents contain provisions that in whole or in part, through reference in this text, constitute provisions of this standard.

3. COMPLIANCE NOTATION

As used in this document, “shall” denotes a mandatory provision of the standard. “Should” denotes a provision that is recommended but not mandatory. “May” denotes a feature whose presence does not preclude compliance that may or may not be present at the option of the implementer.

4. DEFINITIONS

All the provisions of A/53, Part 1 [3], Section 3 shall apply when any such provisions or definitions are used in this Part.

5. SYSTEM OVERVIEW (INFORMATIVE)

The transport format and protocol for the ATSC Digital Television Standard is a compatible subset of the MPEG-2 Systems specification defined in ISO/IEC 13818-1 [4]. It is based on a fixed-length packet Transport Stream approach which has been defined and optimized for digital television delivery applications.

The reader is referred to Section 5 of A/53 Part 3 [1] for additional information on the system overview.

Not shown explicitly in A/53 Part 3 Figure 5.1 [1], but essential to the practical implementation of this Standard, is a control system that manages the transfer and processing of the elementary streams from the application encoders. The rules followed by this control system are not a part of this Standard. The output of the control system implementation shall conform to the MPEG-2 Transport Stream coding as specified in ISO/IEC 13818-1 [4] with the additional constraints specified in this Standard.

6. SPECIFICATION

This section of the standard describes the coding constraints that apply to the use of the MPEG-2 systems specification ISO/IEC 13818-1 [4] in the digital television system.

6.1 MPEG-2 Systems Standard Usage

The transport subsystem shall comply with the Transport Stream definition of the MPEG-2 Systems standard as specified in ISO/IEC 13818-1 [4] and shall be further constrained as specified in ATSC A/53 Part 3 [1] and herein. Program shall mean the collection of all elements

within the emission that have the same value of MPEG-2 `program_number`, independent of the methods used to propagate the program elements.

The `stream_type` value for AVC video program elements shall be as defined ISO/IEC 13818-1 [4] which is 0x1B. The video T-STD for AVC shall be as defined in Section 2.14.3.1 of ISO/IEC 13818-1 [4] and shall follow the constraints for the profile and level encoded in the video elementary stream in Appendix A of ISO/IEC 14496-10 [2].

An AVC Access Point, as defined in Section 6.1.3 of ATSC A/72 Part 1 [5], shall occur at least once per second. See also SCTE 128 [6] Section 6.4.1 for additional background.

Video streams of `stream_type` 0x1B shall be identified and constrained as described hereinafter.

6.2 Constraints on PSI

All program elements in the Transport Stream are described in the PSI and shall conform to the requirements of ATSC A/53 Part 3 [1] and the following:

- When the video elementary `stream_type` is equal to 0x1B the descriptor loop immediately following `ES_info_length` in the `TS_program_map_section()` shall contain the AVC `video_descriptor()` described in Section 2.6.54 of ISO/IEC 13818-1 [4] with the `AVC_24_hour_picture_flag` set to '0'. For video sequences that contain AVC still pictures, the `AVC_still_present` field shall be set to '1' in this descriptor; otherwise this flag shall be set to '0'.
- When the video elementary `stream_type` is equal to 0x1B, the `data_stream_alignment_descriptor` is not required, except as specified in Section 6.4.
- When private data bytes of the adaptation field of the TS packets are in use, with tag, length, and data structures as defined in Section 6.4.2 of SCTE 128 [6], the descriptor loop immediately following `ES_info_length` in the `TS_program_map_section()` shall contain the `SCTE_adaptation_field_data_descriptor` as described in Section 6.3.2.3 of SCTE 128 [6]. In the absence of such adaptation field private data, the descriptor shall not be included in the corresponding `ES_info_loop` of the PMT.

6.3 Virtual Channels and Parameterized Services

Any virtual channel referencing an MPEG-2 program carrying a video component of `stream_type` 0x1B shall identify such channel within all transmitted VCTs (TVCT and/or CVCT per A/65 [7]). The `service_type` value for all such virtual channels shall be set to 0x07. Such virtual channels (including their signaling) shall comply with the ATSC A/71 Parameterized Services Standard [8].

For Virtual Channels signaled as being `service_type` 0x07, as required by A/71 [8] there is a `component_list_descriptor()` present in the descriptor loop following the `descriptors_length` field in the virtual channel descriptor loop of any `terrestrial_virtual_channel_table_section()` or `cable_virtual_channel_table_section()`. For each `stream_type` present in inner loop of the `component_list_descriptor()`, there shall be a `stream_info_details()` present.

The contents of the `stream_info_details()` for `stream_type` 0x1B shall be structured as shown in Table 6.1.

Table 6.1 Stream Information Details Syntax for AVC video

Syntax	No. of Bits	Format
stream_info_details() {		
AVC_profile	2	uimsbf
level_idc	6	uimsbf
caption_data_rate	3	uimsbf
reserved	5	uimsbf
}		

Note: This structure may be extended in the future. Such extensions will be added by either defining uses for the reserved bits or adding new bytes to the end of the structure. Readers should also consult the list maintained by the ATSC Code Points Registrar.

AVC_profile — This is a two-bit unsigned integer field encoding a range of values for `profile_idc` from Table 6.3 of ATSC A/72 Part 1 [5]. Values shall indicate the AVC Profile in use: ‘01’ = Baseline (for the value of `profile_idc` = 66); ‘10’ = Main (for the value of `profile_idc` = 77); and ‘11’ = High (for the value of `profile_idc` = 100). As specified in Section 6, all receiving devices that support a higher binary-numbered profile must support all lower numbered profiles. The highest profile that will be used for the virtual channel associated with the `component_list_descriptor()` carrying this `stream_info_details()` shall be sent.

level_idc — This is a six-bit unsigned integer field. Values shall be as defined in Table 6.3 of ATSC A/72 Part 1 [5]. As specified in A/72 Part 1, all receiving devices that support a higher binary-numbered level must also support a lower numbered level. The highest level that will be used for the virtual channel associated with the `component_list_descriptor()` carrying this `stream_info_details()` shall be sent.

caption_data_rate — This is a three-bit unsigned integer field specifying the transport rate for CEA-708 [9] caption data. The values shall be per Table 6.2 below. Non-zero values shall indicate rates less than 9600 bps when defined.

Table 6.2 CEA-708 Caption Data Rate Values

CEA-708 Transport Bitrate	caption_data_rate values
9600 bps	‘000’
reserved	‘001’-‘111’

6.4 PES Constraints

Packetized Elementary Stream syntax and semantics shall conform to the requirements of ATSC A/53 Part 3 [1]. For streams of `stream_type` 0x1B, each PES packet shall contain only one AVC access unit start, as defined in Sections 2.1.3 and 2.14.1 of ISO/IEC 13818-1 [4], unless multiple access units fit into the payload of a single transport packet. Section 6.4.1 specifies the constraints for the case when multiple access units are placed in a PES packet. The access unit start code is not required to be aligned with the PES packet header (to avoid overhead for low bit rate and SDTV resolutions) and alignment of the access unit to PES packet header shall be signaled using the `data_alignment_descriptor` in the PMT (see Section 6.2). Each PES header shall contain a PTS and DTS if DTS differs from the PTS. The PES packet shall be void of video picture data only when

transmitted in conjunction with the `discontinuity_indicator` to signal that the `continuity_counter` may be discontinuous.

Within the PES packet header, the following restrictions apply:

- The `PES_packet_length` shall be coded as ‘0x0000’.
- If the `data_stream_alignment_descriptor` is present in the PMT, then the `data_alignment_indicator` shall be set to ‘1’

6.4.1 Multiple Access Units in a PES Packet

When a PES packet contains multiple access unit starts, for any access unit starts following the first access unit start in the same PES packet, the ISO/IEC 14496-10 [2] syntax elements `num_units_in_tick`, `time_scale`, `pic_struct` (if present), and the value of syntax variables `TopFieldOrderCnt` and `BottomFieldOrderCnt` of the access unit shall allow the derivation of PTS and DTS for that access unit.

6.4.2 Adaptation Field Private Data

As defined in Section 6.4.2 and Appendix A of SCTE 128 [6], the `AU_information()` structure may be placed into the Adaptation Field Private Data of the TS packet carrying PES data. When this structure is placed in the TS packet, the `SCTE_adaptation_field_data_descriptor` shall appear in the PMT as specified in Section 6.2.

6.5 Support for Still Pictures

AVC still pictures may be used and when used shall be constrained as follows:

- The still picture coding shall comply with the definitions in AMD-3 to ISO/IEC 13818-1 [4] section 2.1.5 and 2.14.3.1.
- `low_delay_hrd_flag` (as defined in ISO/IEC 14496-10 [2]) can be either set to ‘0’ or ‘1’. For still picture applications, it is recommended that the `low_delay_hrd_flag` be set to ‘0’.
- If a PES packet contains any part of a still picture, it shall contain the complete access unit with the still picture, and no part of any other access unit. This access unit shall be aligned to the PES packet header, which shall contain a coded PTS value¹.
- The time interval between successive still pictures shall be less than or equal to 60 seconds.
- The PMT for this program element shall include the `AVC_video_descriptor` with the `AVC_still_present` flag set to ‘1’.

1. As in MPEG-2 based systems, even though the PTS values between successive still pictures increase monotonically, this may not be true near the rollover period of system clock.
