Data Standards Subcommittee

AMERICAN NATIONAL STANDARD

ANSI/SCTE 24-19 2004
(Formerly DSS 02-18)

IPCablecom CMS Subscriber Provisioning Specification

NOTICE

The Society of Cable Telecommunications Engineers (SCTE) Standards are intended to serve the public interest by providing specifications, test methods and procedures that promote uniformity of product, interchangeability and ultimately the long term reliability of broadband communications facilities. These documents shall not in any way preclude any member or non-member of SCTE from manufacturing or selling products not conforming to such documents, nor shall the existence of such standards preclude their voluntary use by those other than SCTE members, whether used domestically or internationally.

SCTE assumes no obligations or liability whatsoever to any party who may adopt the Standards. Such adopting party assumes all risks associated with adoption of these Standards, and accepts full responsibility for any damage and/or claims arising from the adoption of such Standards.

Attention is called to the possibility that implementation of this standard may require the use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. SCTE shall not be responsible for identifying patents for which a license may be required or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

Patent holders who believe that they hold patents which are essential to the implementation of this standard have been requested to provide information about those patents and any related licensing terms and conditions. Any such declarations made before or after publication of this document are available on the SCTE web site at http://www.scte.org.

1 SCOPE

1.1 Purpose of document

IPCablecom 1.0 service provisioning can be viewed as two distinct operations: Multimedia Terminal Adapter (MTA) provisioning and Call Management Server (CMS) subscriber provisioning. This Recommendation defines the interface used between the CMS and Provisioning Server for the exchange of service provisioning information.

The interface employs a Web Service model. Specified in Web Service Description Language (WSDL 1.1) [9] the interface transports XML encoded objects within Simple Object Access Protocol (SOAP) 1.1 [10] encoded messages over an HTTP 1.1 transport. This interface is secured via IPSec.

The data model transported upon this interface is specifically designed to be extensible, allowing incorporation of as yet undefined IPCablecom features and specific vendor extensions.

1.2 Document Scope

The scope of this document is limited to the provisioning of an IPCablecom 1.0 CMS by a single service provider. Additionally:

- The CMS provisioning interface is limited to the exchange of service activation data between the CMS and the PS. The interface between the PS and the BackOffice Operations Support System (OSS) is out of scope.
- CMS element management and network element provisioning (dial plans, etc.) are out of scope.
- Customer record creation/billing is considered part of the back office OSS application and is currently out of scope.
- This specification serves as a framework for IPCablecom CMS subscriber provisioning. Implementations should adhere to this recommendation as appropriate but may not always support all elements, parameters and features as shown in the annexes.

1.3 Requirements

If this Recommendation is implemented, the key words “MUST” and “SHALL” are to be interpreted as indicating a mandatory aspect of this specification. The key words indicating a certain level of significance of particular requirements that are used throughout this Recommendation are summarized in the table below:

“MUST”	This word or the adjective “REQUIRED” means that the item is an absolute requirement of this specification.
“MUST NOT”	This phrase means that the item is an absolute prohibition of this specification.
“SHOULD”	This word or the adjective “RECOMMENDED” means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
“SHOULD NOT”	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
“MAY”	This word or the adjective “OPTIONAL” means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

2 REFERENCES

2.1 Normative References

The following documents contain provisions, which, through reference in this text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreement based on this standard are encouraged to investigate the possibility of applying the most recent editions of the documents listed below.

3 TERMS AND DEFINITIONS

This document defines the following terms:

Active	A service flow is said to be "active" when it is permitted to forward data packets. A service flow must first be admitted before it is active.
Endpoint	A Terminal, Gateway or Multipoint Conference Unit.
Gateway	Devices bridging between the IPCablecom IP Voice Communication world and the PSTN. Examples are the Media Gateway which provides the bearer circuit interfaces to the PSTN and transcodes the media stream, and the Signaling Gateway which sends and receives circuit switched network signaling to the edge of the IPCablecom network.
Header	Protocol control information located at the beginning of a protocol data unit.
Key	A mathematical value input into the selected cryptographic algorithm.
Key Management	The process of distributing shared symmetric keys needed to run a security protocol.
Pre-shared Key	A shared secret key passed to both parties in a communication flow, using an unspecified manual or out-of-band mechanism.
Public Key	The key used in public key cryptography that belongs to an individual entity and is distributed publicly. Other entities use this key to encrypt data to be sent to the owner of the key.

4 ABBREVIATIONS

This Recommendation defines the following abbreviations.

AAA	Authentication, Authorization and Accounting
BPP	Basic Pot Provisioning
CFP	Call Feature Provisioning
CID	Circuit ID (Pronounced "kid"). This uniquely identifies an ISUP DS0 circuit on a Media Gateway. It is a combination of the circuit's SS7 gateway point code and Circuit Identification Code (CIC). The SS7 DPC is associated with the Signaling Gateway that has domain over the circuit in question.
CM	DOCSIS Cable Modem
CMS	Cryptographic Message Syntax
CMS	Call Management Server. Controls the audio connections. Also called a Call Agent in MGCP/SGCP terminology. This is one example of an Application Server.
CMTS	Cable Modem Termination System. The device at a cable head-end which implements the DOCSIS RFI MAC protocol and connects to CMs over an HFC network.
Codec	COder-DECoder
CSR	Customer Service Representative
DOCSIS™	Data-Over-Cable Service Interface Specifications
DQoS	Dynamic Quality-of-Service. Assigned on the fly for each communication depending on the QoS requested.
ESP	IPSec Encapsulating Security Payload. Protocol that provides both IP packet encryption and optional message integrity, not covering the IP packet header.
FQDN	Fully Qualified Domain Name. Refer to IETF RFC 821 for details.
HTTP	Hypertext Transfer Protocol. Refer to IETF RFC 1945 and RFC 2068.
IC	Inter-exchange Carrier

IETF	Internet Engineering Task Force. A body responsible, among other things, for developing standards used on the Internet. See www.ietf.org for details
IKE	Internet Key Exchange. A key-management mechanism used to negotiate and derive keys for SAs in IPSec.
IP	Internet Protocol. An Internet network-layer protocol.
IPSec	Internet Protocol Security. A collection of Internet standards for protecting IP packets with encryption and authentication.
ITU	International Telecommunications Union
ITU-T	International Telecommunications Union–Telecommunications Standardization Sector
LNP	Local Number Portability. Allows a customer to retain the same number when switching from one local service provider to another.
MC	Multipoint Controller
MG	Media Gateway. Provides the bearer circuit interfaces to the PSTN and transcodes the media stream.
MGC	Media Gateway Controller. The overall controller function of the PSTN gateway. Receives, controls and mediates call-signaling information between the IPCablecom and PSTN.
MGCP	Media Gateway Control Protocol. Protocol follow-on to SGCP. Refer to IETF 2705.
MIB	Management Information Base
MTA	Multimedia Terminal Adapter. Contains the interface to a physical voice device, a network interface, CODECs, and all signaling and encapsulation functions required for VoIP transport, class features signaling, and QoS signaling.
NCS	Network Call Signaling
OSS	Operations Support Systems. The back-office software used for configuration, performance, fault, accounting, and security management.
PCM	Pulse Code Modulation. A commonly employed algorithm to digitize an analog signal (such as a human voice) into a digital bit stream using simple analog-to-digital conversion techniques.
PCSP	IPCablecom CMS Subscriber Provisioning.
PS	Provisioning server.
PSTN	Public Switched Telephone Network
QCIF	Quarter Common Intermediate Format
RAS	Registration, Admissions and Status. RAS Channel is an unreliable channel used to convey the RAS messages and bandwidth changes between two H.323 entities.
RFC	Request for Comments. Technical policy documents approved by the IETF which are available on the World Wide Web at http://www.ietf.cnri.reston.va.us/rfc.html
SDP	Session Description Protocol
SNMP	Simple Network Management Protocol
SOAP	Simple Object Access Protocol
STP	Signal Transfer Point. A node within an SS7 network that routes signaling messages based on their destination address. This is essentially a packet switch for SS7. It may also perform additional routing services such as Global Title Translation.
TD	Timeout for Disconnect
TFTP	Trivial File Transfer Protocol
TLV	Type-Length-Value. A tuple within a DOCSIS configuration file.
UDP	User Datagram Protocol. A connectionless protocol built upon Internet Protocol (IP).
VoIP	Voice over IP

5 BACKGROUND

5.1 Service Goals

5.2 IPCablecom Reference Architecture

Figure 1 shows the reference architecture for the IPCablecom 1.0 Network. Refer to the IPCablecom Architecture Document [1] for more detailed information on this reference architecture.

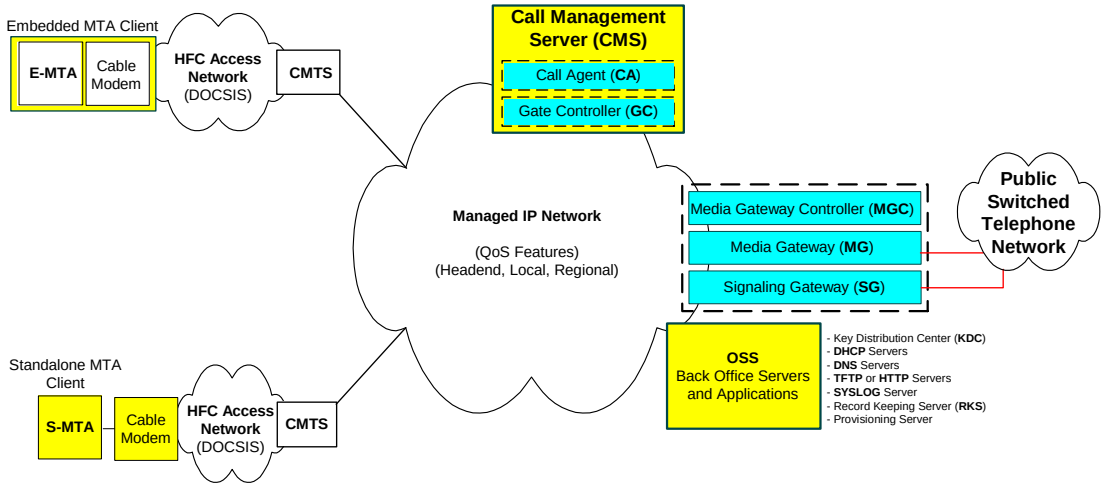

Figure 1. IPCablecom 1.0 Network Component Reference Model (partial)

5.3 Components and Interfaces

Provisioning is defined as the operations necessary to provide a specified service to a customer. IPCablecom service provisioning can be viewed as two distinct operations: MTA provisioning and CMS subscriber provisioning. Figure 2 presents the provisioning related interfaces maintained by the PS to various IPCablecom elements. Interfaces not explicitly labeled are undefined and out of scope for IPCablecom.

This document is intended to set the requirements for the provisioning interface between the CMS and the PS (Pkt-prov-p1).

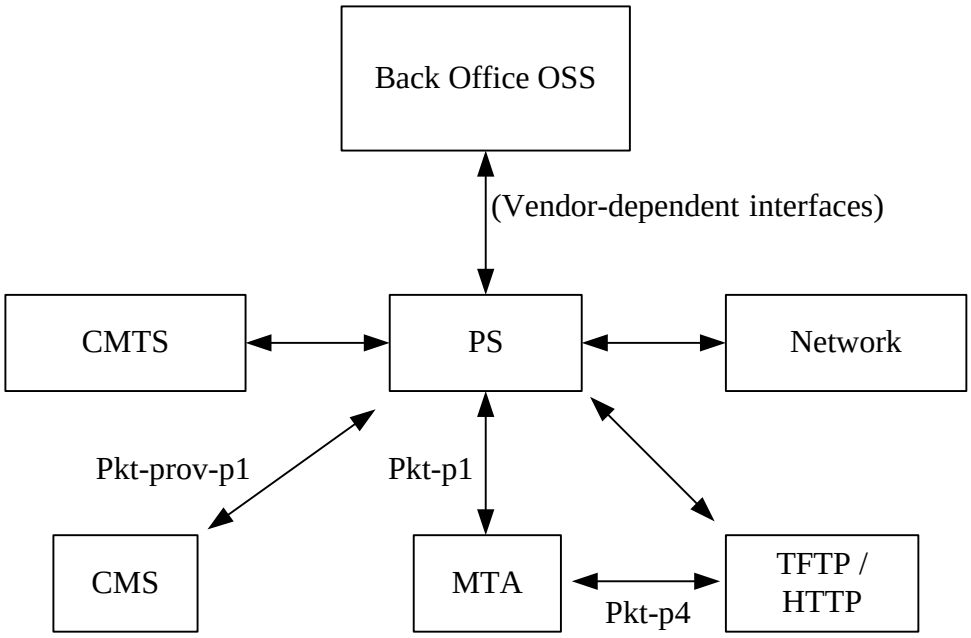

Figure 2. Provisioning Component Interfaces

5.4 Components

5.4.1 Back-office OSS (Service Provider Business and Service Management Systems)

These are the Operations Support Systems (OSSs) that a service provider uses to manage customers and other components that make up their business. These systems provide the IPCablecom provisioning process with service orders to activate services for customers. These systems may also receive accounting or usage data used to create customer-billing events.

5.4.2 Provisioning Server

This system forms the interface between the provider's OSSs and the IPCablecom elements. IPCablecom does not address the implementation of this system or its relationship to other OSSs that a service provider might employ.

The Provisioning Server is defined in [2] as consisting of a provisioning application that contains provisioning logic and a provisioning SNMP entity that provides access to active components. Here we will refer to the Provisioning Server without distinguishing between these two entities.

5.4.3 CMS

The Call Management Server component is described in [1]. This component provides call control and signaling-related services for the MTA and CMTS components in the IPCablecom network.

5.4.4 MTA

A Media Terminal Adapter is an IPCablecom client device that contains a subscriber-side interface to the customer's CPE (e.g. telephone) and a network side signaling interface to call control elements in the network. This component is described in [1].

5.4.5 TFTP

A configuration file service that is the basis for most device configuration in an IPCablecom network. This could be a standalone TFTP Service that delivers statically-defined files to devices or a dynamic service that creates configurations on-the-fly from other data sources.

5.4.6 CMTS

The Cable Modem Termination System provides modem control and packet delivery in and out of an RF network. The CMTS also provides data connectivity to wide-area IP networks. This component is described in [1].

5.4.7 Network

The collection of network elements that may be required to deliver IPCablecom signaling, management, and transport packets to and from service provider networks.

5.5 Interface Descriptions

5.5.1 Pkt-p1

This interface is defined in [2].

5.5.2 Pkt-p4

This interface is defined in [2].

5.5.3 Pkt-prov-p1

The interface defined in this document.

6 ASSUMPTIONS

- The BackOffice OSS is responsible for coordinating endpoint updates with affected network entities (MTAs, CMTSs, etc.) and the CMS.
- CMS will not play a manager role nor does it specify SNMP communications to an MTA during CMS provisioning.
- The CMS and PS reside in the same secure provisioning domain. Security related information will be outlined in the IPCablecom Security Specification [3].

7 SUBSCRIBER PROVISIONING

Subscriber provisioning consists of:

- Customer record/billing support.
- Equipment setup/configuration.

7.1 Customer Records (Billing)

Establishment of a customer record that contains the information needed to deliver service, bill, and collect payment from a customer. Customer record creation/billing is considered part of the back office OSS application and is currently out of scope for IPCablecom.

7.2 Equipment Setup and Configuration

This may include physical installation and/or connection of equipment as well as any software and/or database updates necessary to actually deliver the service to the customer. Equipment setup affects two major components in an IPCablecom environment.

- Customer premises equipment. For IPCablecom, this is the MTA. The provisioning for the MTA is defined in [2] and will not be discussed in this document.
- Call Management Server. Provisioning of the CMS itself can be broken down into two main areas: basic POTS provisioning and call feature provisioning.

7.2.1 CMS Basic POTS Provisioning (BPP)

BPP provides the CMS with the minimal set of data necessary for routing of simple telephony service (POTS) in the IPCablecom network. This minimal set of data consists of a telephone number mapped to its associated MTA's FQDN and NCS endpoint identifier. This data will be used to setup translation tables enabling the CMS to route calls to the appropriate device/port given a specific telephone number. BPP provisioning for each customer is required before that customer can receive any calls in an IPCablecom network.

7.2.2 CMS Call Feature Provisioning (CFP)

In addition to BPP, CFP is performed to provide call features to a customer. CFP is more complicated than BPP as the parameters passed may vary on a feature-by-feature basis and may also be dependent on vendor specific implementations. Additional detailed CFP analysis is considered for future releases.

7.3 Static Versus Dynamic Subscriber Provisioning Data

Data required by the CMS for subscriber provisioning falls into two classifications:

1. Static, billed, permanently assigned service state. This data does not change call to call. Examples would be DQoS settings, call feature subscribed/non-subscribed states, caller ID information, etc.

2. Dynamic, non-billed, semi permanent service state. Often this information is subscriber alterable, either at an endpoint via *XX key code or via a web interface into the CMS. An example would be the user settable parameters of a call feature, such as Call Forward Busy Line (CFBL). The CFBL forwarding number is dynamic, non-billed service state. The subscribed/non-subscribed state of CFBL is static data maintained by the PS.

In the IPCablecom CMS/PS scope, the PS owns all static provisioning state, and the CMS owns all dynamic provisioning state.

8 REQUIREMENTS

8.1 General Requirements

- The interface MUST make no assumptions regarding PS and CMS implementation technologies.

  Multiple partnering vendors will undoubtedly provide CMS and PS implementations on various hardware, software, and development language platforms. A platform and language neutral interface is required.

- The interface MUST support Basic POTS Provisioning.

  The interface's data model MUST include the minimum amount of information required to support basic POTS service.

- The interface MUST support Call Feature Provisioning.

  The interface's data model MUST support subscription to any IPCablecom call feature as defined in [12] and [13].

3. The interface's data model MUST be extensible.

   The present focus of the interface is telephony data. However, to the extent possible, the interface should be extensible for future IPCablecom Multimedia services. It is desirable to have a single, extensible provisioning data model and transport to support all IPCablecom features and capabilities, some of which are not yet defined.

   - The interface MUST not impact any MTA operations in progress.

     Endpoint specific data may be added, deleted, or modified on the MTA without affecting other MTA endpoints or sessions in progress. CMS endpoint provisioning scenarios that would result in an endpoint/MTA to be taken out of service must be carefully documented.

   - The interface MUST be capable of accommodating present (NCS) and future signaling protocols.

8.2 Transport Requirements

- The transport MUST make no assumptions regarding the physical networking infrastructure between a PS and a CMS.

  It is anticipated that multiple service providers will be interoperating over a single managed network. Thus, multiple enterprises will be communicating, potentially using CMS and PS implementations from various vendors, over various network infrastructures (firewalls, proxies, etc.). The CMS/PS transport protocol should facilitate the ability to penetrate arbitrary network infrastructure.

- The transport MUST support unidirectional transfer of single data model objects from the PS to the CMS.

- The transport MUST support efficient transaction of multiple data model objects from the PS to the CMS.

- The transport MAY support unidirectional transfer of single data model objects from the CMS to the PS.

- The transport MAY support efficient streaming of multiple data model objects from the CMS to the PS.

- The transport MUST include semantics to support new, updated, and removed data model objects.

- The transport MUST support informational requests between PS and CMS.

- The transport MUST handle conditions such as CMS busy, errors etc.

- The transport MUST provide positive/negative acknowledgement of operation received.

  The transport MUST implement an at-least-once type of message semantics. The sender MUST not discard its request until the receiver acknowledges it (acknowledgements are not acknowledged.) The transport must be able to detect data corruption during transport, etc. and notify the sender of such conditions.

- The transport MUST provide positive/negative acknowledgement of operation handled.

- The PS MUST be able to initiate a transfer of data model objects.

- The transport MUST be secure.

9 DATA MODEL

This section provides a high level description of the PCSP data model and its XML encoding. The normative, authoritative definition of the data model and its encoding is found in the PCSP XML schema in Annex A.

9.1 Overview

The data model for IPCablecom CMS provisioning is displayed in Figure 3. It consists of two categories of entities:

- Objects
- Relations between objects

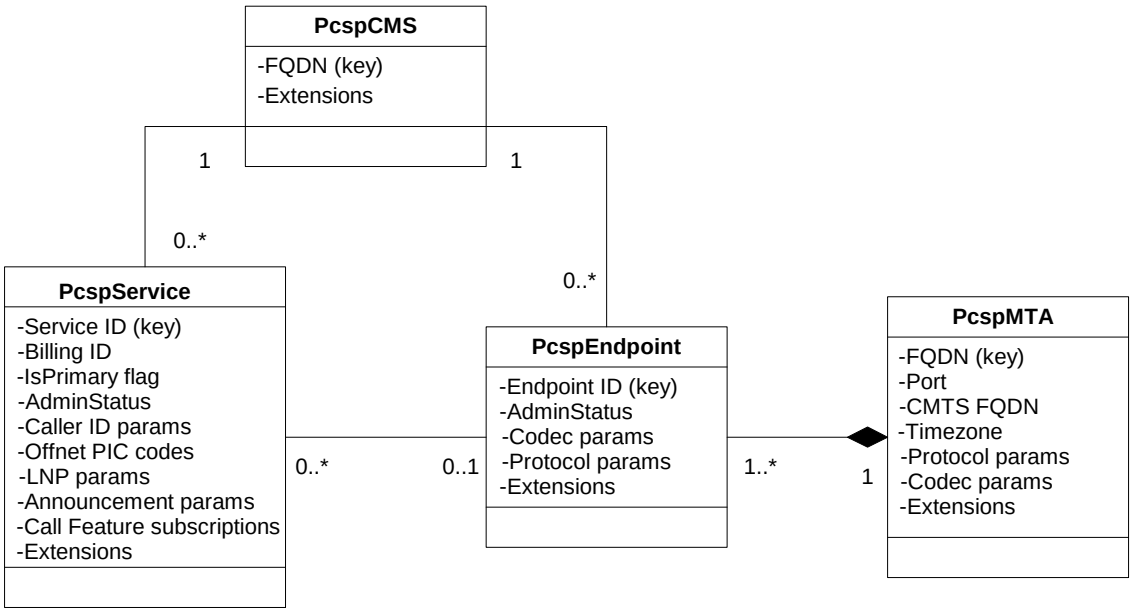

Figure 3. CMS Provisioning Data Model[1]

The following entities MUST be supported:

- The PcspService object is the entity to which an IPCablecom 1.0 customer subscribes. It represents a phone number and all related functionality (call features, etc).
- A PcspMTA object represents a Media Terminal Adapter, which aggregates one or more endpoints physically contained within the MTA.
- The PcspEndpoint object represents a physical endpoint on an MTA/Gateway.
- A PcspCMS object maintains associations between endpoints/CMSs and services/CMSs.
- PcspRelations represent associations between objects. In Figure 3, they are presented as connections between objects.

PcspService and PcspEndpoint are distinct objects in order to support multiple services (phone numbers) per endpoint. Distinct PcspMta and PcspEndpoint objects allow an MTA's endpoints to be managed by different service providers. The PcspCms object essentially maintains a collection of endpoints and services.

All objects are extensible.

9.1.1 PcspService Object

The service object is the entity to which an IPCablecom 1.0 customer subscribes. It represents a phone number and all related functionality. The data model allows more than one service to be provisioned to a single endpoint.

The PcspService object contains the following generic information (for complete details, see the PCSP XML schema):

[1] Note, a project contain one or more activities, the "1..*" and other strings attached to on the project and activities association is called the *multiplicity* of the activity class within the relationship. See a Unified Modeling Language (UML) reference for additional detail.

- ServiceId - a unique identifier for the service.
- BillingId - the identifier of another service, which will be billed for activity on this service.
- IsPrimary flag - with multiple services provisioned upon an endpoint, one service MUST have this flag set to indicate the default service to use for outgoing calls.
- PrimaryRingPattern - index into MTA cadence table, selecting a ring pattern for this service.
- Administrative status of this service (suspended, enabled, number has changed. etc.)
- DisplayName - the display information used for Call Name Delivery feature (CNAM)
- DisplayNumber - the display information used for Call Number Delivery feature (CND)
- Announcement settings (enable, language, time zone, etc.)
- Carrier codes (long distance carrier code, intra-lata carrier code, international carrier code)
- Local number portability control (porting status, STP lookup flag, etc).
- Call features. A service includes a list of subscribed call feature objects (as described in [12] and [13])
- Extensions. This object is extensible in two locations: the main body of the object, and the call feature list.

9.1.2 PcspMta Object

A Media Terminal Adapter aggregates one or more endpoints (physically contained within the MTA). It contains the following generic information (for complete details, see the PCSP XML schema):

- MTA's FQDN, uniquely identifying this MTA.
- MTA's NCS listener port (default: 2427)
- FQDN of controlling CMTS.
- Time zone within which this MTA is physically located.
- Signaling protocol designation. This is the default protocol selection for all contained endpoints, unless overridden by an individual endpoint.
- Codec designation - default codec selection for all contained endpoints, unless overridden by an individual endpoint.
- A single point for extension.

9.1.3 PcspEndpoint Object

An endpoint is a physical port on a MTA/Gateway. It contains the following generic information (for complete details, see the PCSP XML schema):

- EndpointId - uniquely identifies this endpoint.
- Signaling protocol selection. Optionally overrides MTA setting.
- Administrative status of the endpoint (disconnected, normal service, test mode, etc.).
- Codec selection. Optionally overrides MTA setting.
- A single point for extension.

9.1.4 PcspCMS Object

This object maintains associations between Endpoints/CMSs and Services/CMSs. It contains the following generic information (for complete details, see the PCSP XML schema):

- FQDN uniquely identifying this CMS.
- A single point for extension.

9.1.5 Inter Object Relationships

Within Figure 3, the lines connecting the classes represent object "relations" (sometimes called associations). The relations depicted in Figure 3 MUST be supported:

- Service/CMS. A typical CMS will own a block of phone numbers.
- Endpoint/CMS. An endpoint requires a CMS for signaling purposes.

- Service/Endpoint. A phone number must be attached to a physical endpoint.
- Endpoint/MTA. MTAs physically contain endpoints.

9.2 Relations are encoded using the PcspRelation entity.XML Encoding

Objects of the data model will be encoded using XML.

9.2.1 The PCSP XML Schema

Annex A contains the PCSP XML schema. The schema defines the XML encoding syntax for the following entities (the entities MUST adhere to the schema):

- The PcspService, PcspEndpoint, PcspMta, and PcspCms objects. These are the main data model objects.
- PcspRelation. This is used to establish or teardown relations between objects.
- PcspImportExport. A general purpose document format that can contain a large number of objects or relations. This will typically be used to export full data sets from a PS to a CMS.

The schema SHOULD be employed by validating XML parsers to determine syntactic correctness of encoded entities.

9.2.2 Sample PCSP Entity Encodings

Sample XML encodings of all the PCSP data model entities can be found in Appendix I.

9.2.3 Object Extensions

The PCSP XML schema permits extensions for all objects (PcspService, PcspEndpoint, PscpMta, and PcspCms). Extensions are accomplished via the <Extension> element placed in each object. Most objects specify this element at the end of the main body of the object. PcspService includes an additional <Extension> element at the end of the call feature list.

There are a few simple rules for the <Extension> element.

- All <Extension> elements MUST specify a namespace definition.
- All sub-elements of <Extension> must be namespace qualified.

These two rules permit the XML parsing system to validate the <Extension> content against a vendor supplied XML schema file. Appendix II contains an extension example.

10 MESSAGING

10.1 Overview

The PCSP interface follows a Web Service paradigm. The interface MUST employ SOAP 1.1 messages to transfer XML encoded entities (from the PCSP data model) between client and server. Messages MUST be transported between client and server using the HTTP 1.1 protocol. For a complete discussion of the transport considerations, see Appendix III.

The interface is modeled on a synchronous request/response pattern (or remote procedure call – RPC). The following messaging patterns are supported between client and server.

- PUT message. Client writes one or more XML encoded objects or relations to the server. Both creation of new objects and modification of existing objects are supported.
- DELETE message. Client requests one or more objects or relations be deleted from the server.
- GET message. Read one or more XML encoded objects from the server (objects only…relations are not supported).
- CMDSTATUS message. Used to transfer "out of band" commands and status between the client and server. Client can notify server of various state conditions. Client can command server to perform various actions. This message is vendor extensible.

10.2 CMS and PS Messaging Role Requirements

In general, both CMS and PS MAY be implemented to fully support client and server messaging roles. However, within the scope of IPCablecom CMS provisioning, the CMS and PS assume the role requirements specified below.

Table 1. CMS and PS Messaging Roles

Message	CMS as client	CMS as server	PS as client	PS as server
GET	OPTIONAL	MUST	MUST	OPTIONAL
PUT	OPTIONAL	MUST	MUST	OPTIONAL
DELETE	OPTIONAL	MUST	MUST	OPTIONAL
CMDSTATUS	MUST	MUST	MUST	MUST

The following points should be noted:

- A CMS MUST support the server role for GET, PUT, and DELETE.
- A PS MUST support the client role for GET, PUT, and DELETE.
- CMS and PS MUST support client and server roles for CMDSTATUS.
- All other behavior is OPTIONAL.

These requirements enforce provisioning data flows from the PS to the CMS and also ensure that the CMS is not required to push dynamic data changes (user adjustable call feature changes, etc.) back to the PS.

The PS is able to read specific objects from the CMS. This use case is supported primarily to allow the PS to retrieve user call feature settings ("dynamic data") owned by the CMS. This is accomplished by reading specific PcspService objects from the CMS.

Figure 4 displays all the required messaging roles.

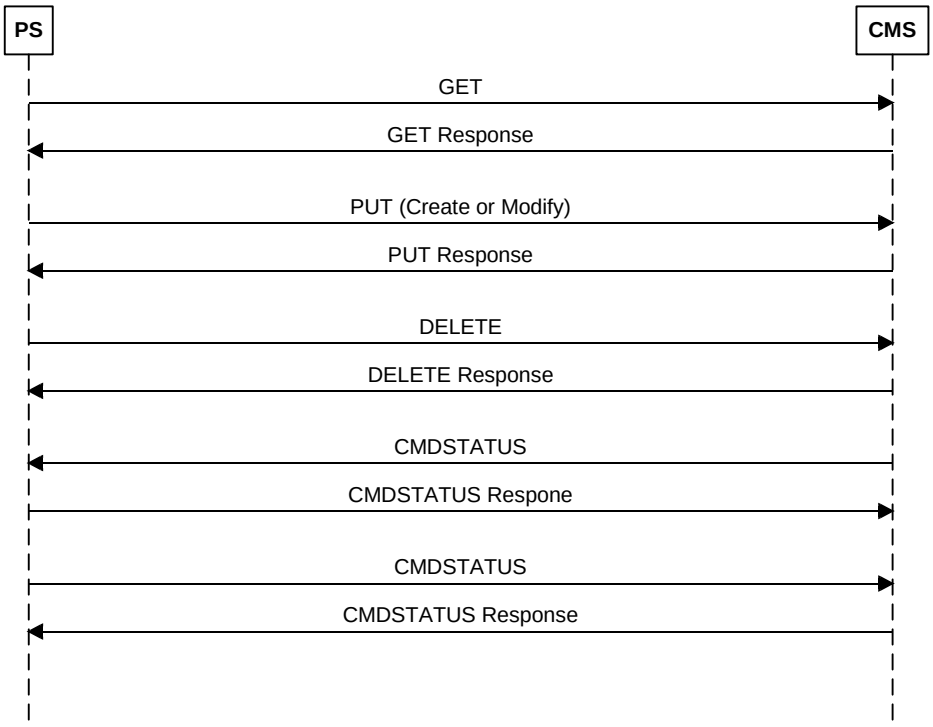

Figure 4. Required Messaging Flows

10.3 WSDL Specification

The PCSP interface is specified using Web Service Description Language 1.1. Just as with a Corba IDL, the WSDL interface definition specifies the remote methods on the interface, the arguments the methods accepts, the return values from the methods, and any interface specific data types that must be defined. Additionally, the WSDL definition also specifies the message encoding format (SOAP 1.1) and the transport binding (HTTP 1.1).

The WSDL is fed into various Web Services toolkits, available for most operating systems and languages, to automatically generate client interface stubs, server skeletons, and SOAP marshalling support.

PCSP clients and servers MUST be based upon WDSL 1.1 and MUST adhere to the transport binding HTTP 1.1 and MUST adhere to this WSDL definition presented in Annex B.

11 SECURITY

The PCSP interface is secured using the IPSec ESP protocol in transport mode. Key management is implemented using IKE with pre-shared keys. This security infrastructure is already used at the CMS for various interfaces. See [3] for full details.

Annex A - PCSP XML Schema

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- edited with XML Spy v4.0.1 U (http://www.xmlspy.com) by Paul Duffy (private) -->
<!--
    IPCablecom CMS Subscriber/Service Provisioning (PCSP) schema.

    PCSP defines a messaging interface and an XML encoding format for objects
    transmitted over that interface.  This schema defines the XML encoding syntax for
    the objects transmitted over the PCSP interface.

    Encodings for PcspService, PcspEndpoint, PcspMta, and PcspCms objects are specified.
    A PcspRelation encoding describes associations between objects.
    A PcspImportExport encoding is used to produce instance documents containing large numbers of objects.
-->
<xs:schema targetNamespace="<unique_fully_qualified_namespace>" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns="<unique_fully_qualified_namespace>" elementFormDefault="qualified">
<!-- Note: the parameter <unique_fully_qualified_namespace>  MUST be replaced by unique identifiers for the actual
implementation of the XML Schema.

<!--
    ======================== Call Features. ============================

    A service includes a list of call feature objects, each encoding one of the call features
    described in PKT-TR-VOIPBRF-R01-000608 and PKT-TR-VOIPERF-R01-000831.

    Each call feature includes its "static" state data (owned by the PS):
        Feature name (implicitly as the element name),
        Subscribed/non subscribed state,
        Administrative state the feature.

    Many call features include just this information.
    Absence of a specific call feature implies the feature is not subscribed.
    The subscribed state is used to indicate that an
    explicitly listed call feature is not subscribed (an atypical case).

    Several features extend the “static” parameter set with feature specific data.
    This feature specific data is typically configured by the user (via handset or by calling a CSR).
    The PCSP spec classifies the user adjustable data as "dynamic", meaning that it is owned
    by the CMS.  Changes to the dynamic data in the CMS are not required to be pushed back to the PS.

<!--
    The definition of each of the supported call features...

    All call features can be considered in two parts.
    1. Common section containing the administrative state of the feature (the "static" data).
    2. An optional section containing feature specific parameters, typically set by the end user (the "dynamic" data).
-->
<!--
    The "base object" for all call features, containing:

    Subscribed -
        0/false: feature is not subscribed
        1/true: feature is subscribed.

    AdminStatus -
            0: feature is suspended by service provider.
            1: feature is enabled by service provider..

    In general, presence of a call feature implies that it is subscribed.
    The  Subscribed flag is supported for the atypical case of wanting to
    indicate that an explicitly listed call feature is not subscribed.

    <!--
        ======================== MAIN OBJECT DEFINITIONS ========================

        There are 6 encodings defined in the PCSP schema.

        The 4 main object encodings:

            PcspCms - a CMS.  A collection of Services and Endpoints.
            PcspService - represents a phone number, its configuration, and call features.
            PcspMta - represents a physical MTA and its configuration.  A collection of Endpoints.
            PcspEndpoint - represents an Endpoint on an MTA.

        A PcspRelation object.  This object encodes the associations between objects.

        A PcspImportExport object. This is used to produce a bulk loading file for the CMS.
    -->
    <!--
        PcspRelation.

        The relation object specifies inter-object associations between the PcspCms,
        PcspService, PcspEndpoint, and PcspMta objects.

        The "relOp" attribute specified if the relation is being added or deleted.
    -->
    <xs:element name="PcspRelation">
        <xs:complexType>
            <xs:sequence>
                <xs:element name="Class1" type="classType"/>
                <xs:element name="Key" type="xs:string"/>
                <xs:element name="Class2" type="classType"/>
                <xs:element name="ListOfKeys" type="ListOfKeys"/>
            </xs:sequence>
            <xs:attribute name="relOp" type="RelationOpType" use="required"/>
        </xs:complexType>
    </xs:element>
    <!--
        The PcspCms object.

        This object maintains associations between Endpoints, Services, and their managing CMSs.

        Contents...

        CmsFqdn - FQDN uniquely identifying this CMS.
    -->
    <xs:element name="PcspCms">
        <xs:complexType>
            <xs:sequence>
                <xs:element name="CmsFqdn" type="nonEmptyString"/>
                <xs:element ref="Extension" minOccurs="0"/>
            </xs:sequence>
        </xs:complexType>
    </xs:element>
    <!--
        The PcspEndpoint object.
```

```
    An endpoint is a physical port on a MTA/Gateway.

    Contents...

    EndpointId - Uniquely identifies this endpoint.   Format per
        “IPCablecom Network Based Call Signaling Protocol Specification”.
        Example: “aaln/1@mta01.cablelabs.com”

    AdminStatus –
        0: endpoint is disconnected
        1: normal - endpoint is in service
        2: test mode - endpoint is under test.

    Protocol - optional override for MTA protocol setting.

    Codec - optional override for MTA codec setting.
-->
<xs:element name="PcspEndpoint">
    <xs:complexType>
        <xs:sequence>
            <xs:element name="EndpointId" type="nonEmptyString"/>
            <xs:element name="AdminStatus">
                <xs:simpleType>
                    <xs:restriction base="xs:integer">
                        <xs:enumeration value="0"/>
                        <xs:enumeration value="1"/>
                        <xs:enumeration value="2"/>
                    </xs:restriction>
                </xs:simpleType>
            </xs:element>
            <xs:element name="Protocol" type="protocolType"/>
            <xs:element name="Codec" type="codecType"/>
            <xs:element ref="Extension" minOccurs="0"/>
        </xs:sequence>
    </xs:complexType>
</xs:element>
<!--
    The PcspMta object.

    A Media Terminal Adapter aggregates one or more endpoints (physically contained within the MTA).

    Contents...

    MtaFqdn - MTA’s FQDN, uniquely identifying this MTA.
    MtaPort - MTA’s NCS listening port (default: 2427)
    CmtsFqdn - FQDN of controlling CMTS.  CMS needs this to establish MTA DQoS with correct CMTS.
    Timezone - within which this MTA is physically located. Per RFC 1123 numeric timezone format.
    Protocol - must be set to “MGCP 1.0 NCS 1.0”. This is the default for all contained endpoints.
    Codec - default for all contained endpoints.
-->
<xs:element name="PcspMta">
    <xs:complexType>
        <xs:sequence>
            <xs:element name="MtaFqdn" type="nonEmptyString"/>

            <xs:element name="Codec" type="codecType"/>
            <xs:element ref="Extension" minOccurs="0"/>
        </xs:sequence>
    </xs:complexType>
</xs:element>
<!--
    The PcspService object.

    Contents...

        ServiceId - unique identifier for the service.
```

```
        AdminStatus -
            0: suspended (i.e. bill not paid).
            1: enabled (normal state).
            2: number has changed.
            3: out of service.
            4: unassigned.

        BillingId - An telephone number identifying another service to be billed instead of this service.

        ExternalId - an arbitrary string used to carry such data as subscriber ID, etc.

        IsPrimary - With multiple services provisioned upon an endpoint, one service MUST
                    have this flag set to indicate  the default service to use for outgoing calls.
            false/0: this service is not a primary service.
            true/1: this service is a primary service.

        PrimaryRing - Primary Ringing Pattern ID. Index into MTA cadence table, selecting ring pattern for this service.

        DisplayName - Used for Call Name Delivery feature (CNAM)

        DisplayNumber - Used for Call Number Delivery feature (CND)

        Password - various call features require a password before any alterations are permitted.

        Network announcement control. See previous definition.

        Interexchange codes and Local Number Portability settings. See previous definitions.

        Call features.  See previous definitions.

        The <types> section defines custom datatypes required by the interface.

        PCSPI01 requires two custom datatypes:
            PcspArg (and array of)
            PcspObj (and array of).

        // PcspArg (pseudo code)
        //
        class PcspArg
        {
            // EntityName and key of a specific object.
            // Wildcard are currently not permitted.
            // Key is ignored when entity is PcspRelation.
            //
            String entityName;
            String key;

            // Reserved for future use.  Set to 0 for now.
            //
            int flags;
        }

        // PcspObj (pseudo code).
        //
        class PcspObj
        {
            // EntityName and key of the specific object.
            // Key is ignored when entity is PcspRelation.
            //
            String entityName;
            String key;

            // cmdStatus:
            //    PcspObj as method output/result - MUST be set to one of the status codes specified below.
            //    PcspObj as input to Put() -  MUST be set to one of the following:
            //          1, create new object
            //          2, modify existing object.
            //  This field is ignored when entity is PcspRelation.
            //
            int cmdStatus;

            // XML encoding per PCSP Data Model Schema or 0 (null)
            //
            String xmlEncoding;
        }

        EntityNames; MUST be one of the following:

            "PcspService"
            "PcspMta"
            "PcspEndpoint"
            "PcspCms"
            "PcspRelation"
```

```
    Status codes:  Used for method output or contained in the cmdStatus field of a PcspObj result (output).

        0 , Operation succeeded
        1 , Object not found
        2 , Invalid Put() mode specified.
        3 , Object creation failed, object already exists
        4 , Read op failed
        5 , Create op failed
        6 , Modify op failed
        7 , Delete op failed
        8 , Internal problem.
        9 , Server Busy
        10, Unsupported operation.
        11, Vendor extension.

    ...extended as needed...

Appendix II - Sample Object Extension

For the purpose of the following examples it was assumed that the parameter <unique_fully_qualified_namespace> as defined in Annex A was set to “http://www.cablelabs.com/Pcsp/I01/schema”.

II.1 Extended PcspService Object Example

The following example illustrates the extension capabilities of the PCSP schema. The example extends a PcspService object with a new call feature and several new elements on the main body of the object.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
    An example illustrating how to extend a Pcsp object.
    This example extends  the PcspService object with additional
    fields and call features.

    See details below.
-->
<PcspService xmlns="http://www.cablelabs.com/Pcsp/I01/schema" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:pcsp="http://www.cablelabs.com/Pcsp/I01/schema">
    <!--
        The main body of the Service object is filled with sample data that will
        allow the object to validate.
    -->
    <ServiceId>5551212</ServiceId>
    <AdminStatus>0</AdminStatus>
    <BillingId>5551212</BillingId>
    <ExternalId>5551212</ExternalId>
    <IsPrimary>true</IsPrimary>
    <PrimaryRing/>
    <DisplayName/>
    <DisplayNumber/>
    <Password/>
    <Announcements>
        <Language>EN</Language>
        <Timezone>+0500</Timezone>
    </Announcements>
    <InterExchange>
        <PIC>0</PIC>
        <LPIC>0</LPIC>
        <IPIC>0</IPIC>
    </InterExchange>
    <LNP>
        <PortingStatus>1</PortingStatus>
        <LNPT>true</LNPT>
    </LNP>
    <!--
        A Service object can be extended in two locations:
            1. The main body of the object.
            2. The call feature list.

        Here we extend the set of call features with the CfXYZ call feature.

        1. The VendorExt element must specify a valid namespace for the extension's schema. This allows
            the parsing system to locate the schema file for the extension.
        2. Any content within the VendorExt element must be namespace qualified, enabling validation against
            the extension's schema.
    -->
    <ListOfCallFeatures>
        <Extension xmlns:ext="http://www.cablelabs.com/SampleExtension">
            <ext:CfXYZ>
                <ext:Subscribed>true</ext:Subscribed>
                <ext:Enabled>true</ext:Enabled>
            </ext:CfXYZ>
```

```
        </Extension>
    </ListOfCallFeatures>
    <!--
        Here, we extend the data content of main body of the Service object.
    -->
    <Extension xmlns:ext="http://www.cablelabs.com/SampleExtension">
        <ext:A>Sample extension A</ext:A>
        <ext:B>Sample extension B</ext:B>
        <ext:C>Sample extension C</ext:C>
    </Extension>
</PcspService>
```

II.2 The Extension Schema

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
    The schema for the sample PcspService extension.

    This schema defines several extensions:

    A, B, and C for the main body of the Service object.
    Call feature CfXYZ for the Service's call feature list.
-->
<xs:schema targetNamespace="http://www.cablelabs.com/SampleExtension" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns="http://www.cablelabs.com/SampleExtension" elementFormDefault="qualified">

    <xs:element name="B" type="xs:string"/>
    <xs:element name="C" type="xs:string"/>
    <xs:element name="CfXYZ">
        <xs:complexType>
            <xs:sequence>
                <xs:element name="Subscribed" type="xs:boolean"/>
                <xs:element name="Enabled" type="xs:boolean"/>
            </xs:sequence>
        </xs:complexType>
    </xs:element>
</xs:schema>
```

Appendix III - Data Encoding Evaluation

Options considered for the encoding of data objects and messaging:

III.1 XML

XML is a standard meta-language that allows organizations to design their own markup languages for document publishing and data exchange. Such markups are text based: designed to be obvious to both people and processes. XML offers:

- Open, standards based, platform independent data exchange.
- Standardized parsers for putting data into memory.
- Standardized interfaces (tree-oriented and stream-oriented) for processing the data.
- Standardized ways to display data.
- Standardized ways to query data.
- Standardized ways to link data.
- Standardized training of people in both publishing and data processing.

The cost: somewhat larger encoding size and increased parsing overhead.

The XML specification is supervised by the XML Working Group of the World Wide Web Consortium (W3C). Special Interest Groups of experts from various fields contribute. It is a public standard —it is not the proprietary development of any company. The v1.0 specification was accepted by the W3C as Recommendation on Feb 10, 1998. The specification may be found at http://www.w3.org/TR/REC-xml.

III.2 ASN.1/BER

ASN.1 is a text based, platform independent syntax used to represent arbitrary data structures. It is popularly employed for SNMP MIB representations. The Basic Encoding Rules is a simply recursive algorithm that produces a compact octet encoding from an ASN.1 description. BER encodes each item as a tag, indicating what type it is, a length indicating the size of the object, and a value, which contains the actual contents of the object.

See Table 2 at end of this section.

III.3 Proprietary ASCII

Proprietary encodings are out of scope.

III.4 SDP (session description protocol)

Not flexible in term of contents. Used primarily to describe streaming media capabilities.

III.5 RADIUS

Radius data encoding (TLV) is too primitive and cannot enforce sequencing. RADIUS is difficult and limited to code structures.

III.6 SQL

Tied to a specific relational database implementation/schema. Some vendors may already have databases deployed with incompatible schema.

III.7 Options Summary

Table 2. Data Encoding Options

Option	Pro	Con
XML	Flexible, ASCII tag-based Provides syntax checking through use of schema/DTD. Easy to extend without effecting transport. Allows for vendor extensions. Platform-independent Language-independent	Not secure, requires a secure transport layer. Will consume more CPU and network capacity than a binary encoding. Parse time, etc.
ASN.1/BER	Hierarchical structure for formatting of data. Defines a language for describing the data format (or "schema"). Data structures can be nested. Data is formatted in a platform independent way. Format can be extended IF the design includes a way of versioning the format so that the application knows which format it needs to use to parse the data content.	ASN.1 isn't easily extensible. Backward compatibility of format versions can be difficult to incorporate into the design and to implement. Most implementations use compiled binary level parsers for each schema, which means that defining flexible applications becomes quite difficult. Debugging applications and their interoperability can be difficult in that a small formatting error can render a data "packet" unparseable / unreadable.
Proprietary ASCII	Out of scope	Out of scope
SDP (Session Description)		Not Flexible in term of contents. Used primarily to describe streaming media capabilities.
RADIUS		Radius data encoding (TLV) is too primitive. Cannot enforce sequencing. Difficult and limited to code structures.
SQL		Tied to relational database schema implementation - which some vendors may not use.

III.8 Recommendation: XML

XML provides a platform-agnostic, technology-neutral form of structuring messages and packaging data. It is an excellent choice to send data between heterogeneous applications without each application having to know about the proprietary format of the other. Because XML is a structured language, it is a good fit for hierarchical types of messages. Data can be easily mapped to elements, so the XML document (as a tree structure) takes care of the hierarchy maintenance. The costs: increased wire payload sizes and increased marshalling times (parsing) for objects.

Appendix IV - Transport Protocol Evaluation

IV.1 TFTP with IPSEC

TFTP is already in use within the IPCablecom infrastructure (DOCSIS). It is intended as a lightweight file transfer protocol.

IV.2 Batched RADIUS - multiple records in single request via event msgs.

RADIUS is an IETF standard created primarily to handle Internet dial-up authentication, authorization, and accounting. RADIUS is currently the de facto standard used by most router manufacturers for such activities. Several vendors of IP telephony gateway equipment are already utilizing RADIUS' support for vendor extensions to deliver the information needed for billing.

RADIUS defines both a transport protocol and a specification for message formats. As a transport protocol, RADIUS relies on user datagram protocol (UDP) for message broadcast and is port-based.

As a message format, the data is formatted based on tag-length-value (also called attribute-length-value). Standard authentication, authorization, and accounting tags are pre-defined and are minimally required. However, new attributes can be added without disturbing existing implementations of the protocol. RADIUS has a minimum total message length of 20 characters and a maximum length of 4096 characters. Individual data fields support 247 bytes of data, for example, a 247 character URL or filename.

RADIUS has very poor reliability characteristics and essentially non-existent error recovery, is very limited in new tags (can only define a total of 255) (compare that to 600 existing features in some PSTN class 5 switches).

IV.3 Diameter

Diameter represents an activity in the working group of the IETF that is designed to be backward compatible to RADIUS. It is much more extensible, has increased security benefits, and is designed to minimize configuration. In addition, it supports cross-domain AAA very well by supporting a variety of security schemes such as public key, etc. Diameter supports fail-over to a backup server (it is designed for environments that have low failure requirements (99.99+)). See IETF RFC Diameter Base Protocol [18].

RADIUS/DIAMETER do not provide two-way communication (only acknowledgments) therefore it does not fulfill the requirements.

IV.4 Distributed Object Systems

IV.4.1 CORBA/IIOP

The distributed object technology championed by the Object Management Group. There are upwards of 800 OMG members behind this technology.

The Common Object Request Broker Architecture (CORBA) allows applications to communicate with one another by using an Object Request Broker (ORB). The ORB is middleware that establishes the client-server relationships between objects. The ORB registers clients and manages rights such as publish, subscribe and listener. Using an ORB, a client can transparently invoke a method on a server object, which can be on the same machine or across a network. The ORB intercepts the local call and is responsible for finding an object that can implement the request, pass it the parameters, invoke its method, and return the results.

The Interface Definition Language (IDL) is used to establish the ORB protocol contract between client and server objects. The ORB essentially hides the transportation details from the programmer. The IDL is complied into C++, Java,

etc. implementations of client and server stubs, handling all data encoding/decoding chores required by the IIOP transport protocol used between clients and servers.

CORBA will handle the details of finding the server for a method call, transporting arguments from the client machine to the server machine, and transporting any return code back to the client machine.

ORBs are currently available from many vendors for more than three dozen hardware platforms and operating systems. CORBA is particularly popular on Unix platforms. However, in practice, ORB vendors compete on features. Persistent interoperability problems exist when one gets past the basics (security, etc.). The likelihood of two randomly selected ORBs being able to successfully communicate is low. From a development standpoint, CORBA tends to be very complex. Additionally, CORBA is a relatively expensive option (runtime and development licenses).

IV.4.2 DCOM

Microsoft's Distributed Component Object Model. Shares the following characteristics with CORBA:

- Separates object interface from implementation. This is accomplished using MIDL (Microsoft's IDL variant).
- Allows transparency of location. Clients invoke methods on remote objects without knowing which machine the remote object runs upon.
- Uniform exception handling scheme (DCOM method calls return a flat HRESULT return status)

However…

- DCOM is based on DCE ORPC transport protocol, which in incompatible with IIOP transport used by CORBA.
- DCOM is basically a Microsoft only technology. It is standard on Win95, Win98 and NT platforms.

IV.5 HTTP

Hypertext Transfer Protocol (HTTP) is the primary protocol for the World Wide Web. HTTP was designed to connect heterogeneous data sources together to create a distributed information system. It was also designed with extensibility in mind. A typical HTTP transaction:

1. Client established connection to the server
2. Client issues a request to the server (with URL parameters)
3. Server sends response containing status and requested URL
4. Either side can disconnect.

HTTP provides transaction headers for both client requests and server responses. The client transaction header can include parameters used to assist delivery of the desired information to the client (e.g. type of data format, language etc). The server transaction header can include parameters indicating information about the response (e.g. The status of the request (e.g. return code), the length of the data being sent, the content type, the language of the content, etc).

Given the current state of the Web, HTTP is ubiquitous. It is also firewall friendly.

IV.6 Options Summary

Table 3. Transport Options

Option	Pro	Con
TFTP with IPSEC	Lightweight Already implemented for DOCSIS	Doesn't provide two way communication
RADIUS	Flexible – includes vendor-specific and customer-specific fields. IPCablecom may be able to define fields in this space. Used by many IP telephony accounting systems Already widely deployed on IP components such as routers.	Not all RADIUS products support AAA Application layer needs to handle reliability issues Inadequate built-in security, need an independent trust protocol or shared secret keys with edge routers
Socket based proprietary protocol with SSL		Proprietary. If pursued, we will probably end up writing most of what is currently available in SOAP or XMLP.
CORBA/IIOP	Easy to implement, details of name resolution, packaging parameters into messages and transport are all managed by the CORBA infrastructure	Tends to be a more expensive solution. The CORBA infrastructure must either be developed or purchased, and in either case it must be deployed with the application. There may still remain issues re: interoperability or various CORBA/ORB products.
DCOM	DCOM and CORBA/IIOP are similar technologies.	Basically a Microsoft Windows only option. Won't inter-operate with CORBA-IIOP.
HTTP	HTTP already widely deployed as an underlying transport protocol for exchange between data sources (web servers) and data consumers (client browsers). Data transmission based on simple transactions. Simple, stateless, ASCII text based protocol. Allows for easy data exchange through most currently deployed network infrastructure (firewalls, etc.). Client can use simple method calls when making requests as - GET, POST, HEAD, PUT, DELETE, LINK, and UNLINK.	Being Stateless, the protocol has no memory of the transaction once it finishes. Can it keep up with required CMS transaction rate? Relatively expensive in terms of bandwidth and processing requirements.
